Synthetic Patient-Agent Conversation Evaluation Questionnaire (SPACEQ)

Thank you for participating in the evaluation of synthetic patient-agent conversations related to Type 2 Diabetes management. This questionnaire is designed to assess the quality of multi-turn conversations across four key dimensions: naturalness, fluency, structure, and clarity.

Please read these instructions carefully before using the questionnaire.

Instructions for Evaluators

You will evaluate 20 synthetic conversations between patients and healthcare agents on Type 2 Diabetes management, **focusing specifically on the language level**. Please complete this questionnaire by reading each conversation carefully and rating it on four key dimensions using a scale from 1 (Very Poor) to 5 (Excellent).

Remember that there are no right or wrong answers. We are only interested in your personal evaluation of the synthetic conversation. Completing the questionnaire will take approximately 15–20 minutes.

Rating Scale:

- 1 = Very Poor
- 2 = Poor
- 3 = Acceptable
- 4 = Good
- 5 = Excellent

Evaluation Dimensions

Fluency: How smooth and grammatically correct is the language? Does the conversation flow well?

- **5 (Excellent):** Polished, error-free, smooth reading
- **4 (Good):** Grammatically correct, rare minor issues
- **3 (Acceptable):** Minor errors, overall understandable
- **2 (Poor):** Several errors, meaning sometimes unclear
- **1 (Very Poor):** Frequent grammatical errors, very difficult to follow

Naturalness: How realistic and authentic does the conversation sound? Does it feel like a genuine interaction between real people?

- **5 (Excellent):** Conversation sounds completely natural and realistic
- **4 (Good):** Conversational and varied, flows well
- **3 (Acceptable):** Generally natural with a few stiff spots
- **2 (Poor):** Awkward or templated, limited variation
- **1 (Very Poor):** Completely artificial/robotic, unrealistic phrasing

Clarity: How easy is the conversation to understand? Are medical concepts explained clearly?

- **5 (Excellent):** Very clear, concise phrasing that aids understanding
- **4 (Good):** Clear and easy to follow
- **3 (Acceptable):** Understandable, could be clearer or more precise
- **2 (Poor):** Some confusion, imprecise wording
- **1 (Very Poor):** Confusing, hard to follow

Structure: How well-organized is the conversation? Does it follow a logical sequence and stay on topic?

- **5 (Excellent):** Excellent structure; clear sections/steps that aid comprehension
- **4 (Good):** Well-organized with logical flow or steps
- **3 (Acceptable):** Some structure, could flow better
- **2 (Poor):** Poor organization, confusing structure
- **1 (Very Poor):** No clear structure, completely disorganized

After rating all conversations, please scroll to the bottom of the form and click the **Submit button**. This will securely send your responses to the research team. Once submitted, you will see a confirmation message that your results have been recorded.

Conversation 1

P: I've noticed some blurry vision lately. Does this have something to do with my diabetes?
A: It might, Jan. Persistent high blood sugar from diabetes could cause fluid to enter and swell the lens in your eye, which might affect your ability to focus clearly. Have you been monitoring your blood sugar levels consistently?
P: Yes, I have been, and they've been a bit higher than normal lately.
A: Elevated blood sugar levels could indeed be causing the blurry vision. You should contact your healthcare provider and discuss this. In the meantime, it is advisable to maintain a balanced diet and regular exercise to help control blood sugar levels.
P: Ok, I will get in touch with my doctor. Should I be worried about this leading to more serious eye problems?
A: Uncontrolled diabetes can cause several eye complications over time like diabetic retinopathy, glaucoma, or cataracts. Well-managed diabetes, however, significantly reduces the risk of such complications. Regular eye check-ups are also essential.
P: I understand. I will arrange an appointment for an eye check-up. Thanks for your help.
A: You're welcome, Jan! It's important to address these symptoms promptly. Please reach out if you have more questions or need further assistance.

A: Aicha, can you tell me more about your current strategy for managing your smoking habit, specifically given its impact on your diabetes and overall health?
P: I'm trying to quit smoking but it's really hard. Every now and then I find myself reaching for a cigarette, especially when I'm stressed or after meals.
A: It's great that you're trying to quit, Aicha. Indeed, it can be challenging, especially when it's associated with your daily routines like meals. Have you tried using nicotine replacement therapy or considered any support programs to aid in quitting?
P: No, I haven't tried nicotine replacement therapy. I heard about it but was not sure how it works.
A: Nicotine replacement therapy provides you with nicotine in the form of gums, patches, sprays, inhalers, or lozenges to reduce the cravings associated with nicotine withdrawal. It's advisable to discuss with your doctor or a pharmacist about using these therapies to ensure they're suitable for you given your current medications and health conditions.
P: I see, that sounds like something that might help. What about support programs?
A: There are many support programs available that provide advice, encouragement, and tips to help people quit smoking. They can be in the form of local community groups, telephone-based services, or online forums. You could also consider discussing with your healthcare provider about referral to a smoking cessation program.
P: I'll consider these options.

Conversation 3

P: I'm finding it difficult to control my sweet tooth cravings, especially with the Surinamese sweets I love. I fear this might be affecting my sugar levels. How can I handle this?
A: It's important to manage your sugar intake, Rudolf. If you find it hard to resist traditional Surinamese sweets, consider eating them in moderation or substituting them with lower sugar or sugar-free alternatives. Also, try eating protein or fiber-rich foods to curb your cravings.
P: Are there sugar-free versions of traditional Surinamese sweets?
A: While it might be challenging to find exact sugar-free versions of traditional Surinamese sweets, you could experiment with recipes at home, using sweeteners or substitutes like Stevia which may have less impact on your blood sugar levels.
P: I don't have much time to cook. What about fruit? I have a habit of eating fruits like grapes and bananas. Are they okay?
A: Fruits are a healthier alternative to processed sweets, but they do contain natural sugars. It's fine to include them in your diet, but aim for a variety. Opt for fruits lower in sugar like berries or apples. Also, remember to eat them in moderation.
P: Got it. I'll look for alternatives to traditional sweets and watch my fruit intake. Thanks for the advice.
A: You're welcome, Rudolf!

A: Maria, how have you been doing with maintaining your regular exercise routine?
P: I've been trying, but the weather has been quite unpredictable lately. It makes it a bit difficult to go for my evening strolls.
A: I understand, weather can indeed be a hurdle. Have you considered any indoor exercises for such days?
P: Not yet, but I think I should. Any recommendations?
A: How about trying some mild indoor aerobics or yoga? Both are great for flexibility and balance, and you can easily find tutorials online that cater to all fitness levels.
P: That sounds doable. Will this help with managing my diabetes?
A: Absolutely, Maria! Regular exercise, even if it's mild, can help your body use insulin better, which will help control your blood sugar levels.
P: Alright, I'll give it a try. I appreciate your suggestions!
A: Of course, Maria. Remember to take it slow and gradually increase your exercise intensity. Please let me know if you have any other questions!

P: I'm worried about fasting for Ramadan with my diabetes. Is it possible without harming my health?
A: Yes, Abdullah, fasting during Ramadan is possible with diabetes, but it requires careful planning. You should consult your healthcare provider to adjust your medication and meal times according to your fasting schedule. Regular monitoring of your blood glucose levels is also crucial.
P: What kind of food should I consume during Suhoor and Iftar?
A: For Suhoor, focus on slow-digesting foods like whole grains, lentils, and fruits that provide a steady release of energy. During Iftar, break your fast with dates as is tradition, but be mindful of your portion size because of their sugar content, followed by a balanced meal with lean protein, vegetables and a moderate amount of carbs.
P: What if I feel unwell during the fast?
A: If you feel unwell or your glucose levels go outside of the safe range, you should break your fast immediately. It's important to listen to your body's signals and prioritize your health during Ramadan.
P: Thank you for the guidance, I will discuss this with my doctor as well.
A: You're welcome, Abdullah! Don't hesitate to contact me if you have more questions or need assistance. Your well-being is our top priority.

Conversation 6

A: Great to hear you were able to play chess with your grandchildren, Mohammed! By the way, how are you managing your cravings for traditional Moroccan sweets?
P: It's tough, I must admit. I have a particular weakness for Mint Tea and Chebakia.
A: Mint tea and Chebakia are indeed delicious but high in sugar, which can lead to spikes in your blood glucose levels. Have you tried replacing sugar in your mint tea with a sweetener?
P: I'm not a fan of sweeteners. They don't taste the same. But I'm trying to limit my intake.
A: That's a good start, Mohammed! Limiting your intake is important. To manage your cravings, you could also try snacking on healthy alternatives like a handful of almonds or fresh fruits. They are healthier and can still be quite satisfying.
P: I'll try that. What about exercise? Due to my leg, I can't do much, but I try to go for short walks.
A: That's excellent, Mohammed. Walking is a very beneficial activity for managing type 2 diabetes. Additionally, you can consider simple seated exercises that won't strain your leg but can help increase your physical activity.

P: I've been feeling quite thirsty late at night, even after drinking plenty of water during the day. Is this normal?
A: Julia, increased thirst can be a symptom of high blood glucose levels. Are you checking your blood sugar levels when you're feeling this way?
P: I usually check my blood sugar levels in the mornings and evenings, but I haven't checked when I'm feeling particularly thirsty.
A: Next time you feel excessively thirsty, it may be beneficial to check your blood sugar level. It will give us a better understanding if these thirst episodes are linked to increased blood sugar levels.
P: Alright, I'll do that. Is there anything else I should watch for?
A: You should also monitor for any other symptoms such as frequent urination, dry mouth, or fatigue. If these symptoms persist, it's important to seek medical advice promptly.
P: Thank you, I will keep a closer watch on my symptoms.

Conversation 8

A: Ingrid, have you had any difficulty managing your blood sugar levels during your daily routine?
P: Yes, I've noticed that my blood sugar levels seem higher in the evenings. Could it be related to what I'm eating for dinner?
A: It could be, Ingrid. Could you tell me what your usual dinner looks like?
P: I often have a light dinner with some fish and a lot of veggies. I love to use fresh produce from my garden.
A: That sounds healthy. However, are you also incorporating some form of carbohydrates and protein? A balanced meal can help in maintaining steady blood sugar levels.
P: I wasn't aware of that. I do add some tofu for protein, but I usually avoid carbohydrates at dinner.
A: It's a common misconception that you should eliminate carbs completely in a diabetic diet. However, it's all about the type and quantity of carbs. Opt for whole grains or legumes that are rich in fiber and can help regulate your blood sugar.
P: I see. That's good to know. I will try to include some of these in my dinner. Thanks for the advice!

Conversation 9

P: Do I need to adjust my diet when I'm cooking Surinamese food? I know it can be high in carbs and sugars.
A: Yes, Johan, modifications to your traditional recipes can help manage your blood sugar levels. This can involve reducing the sugar in recipes, substituting white rice with brown or wild rice, and incorporating more vegetables. Also, consider using lean meats and cooking methods like grilling or baking instead of frying.
P: Alright, and what about the portion sizes?
A: Portion control is essential, even with healthier food choices. Try to fill half your plate with vegetables, a quarter with lean proteins, and a quarter with whole grains or starchy vegetables.
P: I see, are there any specific Surinamese dishes that I need to avoid entirely?
A: Not necessarily, Johan, it's about balance. If there's a dish you love that's high in carbs or sugars, have it in moderation and balance it with low-carb meals the rest of the day.
P: That’s reassuring. I’ll try to incorporate these tips in my cooking. Thanks for the help.
A: You're welcome, Johan! It's great that you're making conscious choices about your health. If you have more questions or need further support, feel free to reach out.

Conversation 10

A: Fatima, I noticed you occasionally struggle with the complex medical terms related to your condition. Would you like me to explain some of these terms and how they relate to your diabetes management?
P: That would be really helpful. I often hear the word "insulin resistance". What does that mean?
A: Insulin resistance is when your body's cells don't respond properly to the insulin your pancreas produces. This causes your pancreas to produce more insulin to compensate. Over time, it can't keep up, leading to higher blood sugar levels, which is the central issue in Type 2 Diabetes.
P: I see. And what about "glycemic index"? My doctor mentioned it when talking about my diet.
A: The glycemic index, or GI, is a rating system for foods containing carbohydrates. It shows how quickly each food affects your blood sugar level when that food is eaten on its own. Foods with a low GI (55 or less) are digested, absorbed and metabolised slowly, causing a slower and smaller rise in blood sugar levels.
P: I think I understand now. Is it better to eat foods with a low glycemic index?
A: Yes, that's correct, Fatima. Foods with a low glycemic index are generally better for people with diabetes because they cause a slower, more gradual rise in blood sugar levels, which is easier for your body to manage.
P: That's good to know. I'll be more mindful of that when preparing my meals. Thank you.

Conversation 11

P: I've been managing my diabetes with lifestyle adjustments, but lately, I feel more frequent bouts of fatigue. Is this related to my diabetes?
A: Yes, Ayşe. Fatigue is a common symptom in diabetes and can be a sign of fluctuating sugar levels. Are you monitoring your blood sugar levels regularly?
P: I try to, but sometimes I forget. Also, I worry about the added stress of constant monitoring.
A: I understand your concern, Ayşe. Regular monitoring, however, is essential in managing diabetes and preventing complications. Maybe setting a daily reminder could help you remember?
P: That's a good idea. I will start using reminders. Also, can my diet be causing this fatigue?
A: Possibly, Ayşe. A balanced diet is crucial in controlling sugar levels and preventing fatigue. Ensure your meals are well-balanced with low-glycemic carbs, lean proteins, and lots of vegetables. Remember to keep hydrated as well.

Conversation 12

A: Pieter, have you been able to stick to your regular afternoon walks lately?
P: Not entirely, the weather's been quite unpredictable this week. Should I be worried about missing these walks when it's too chilly out?
A: Missing a few days due to bad weather shouldn't have a significant impact, but it's important to stay active. Have you considered doing some simple indoor exercises when you can't go out?
P: I'd prefer to keep things simple. Are there any easy routines you recommend that I can do indoors?
A: Absolutely, Pieter. You could try light stretching, walking in place, or even utilizing the stairs. Simple activities like these can help maintain your blood sugar levels and overall fitness.
P: I've got a bit of space in the living room; that sounds manageable. And are there any times of day that are better for these exercises?
A: It's generally a good idea to spread out physical activity throughout the day to help with blood sugar regulation, but perhaps right after a meal could be particularly beneficial. Keep it consistent with when you feel most energetic.

P: I've read garden herbs can have benefits for managing diabetes. Do you know if any specific ones are truly helpful?
A: Yes, Johanna, some herbs like cinnamon and fenugreek may help regulate blood sugar. Adding them to your diet could provide some benefits, but it's vital to continue your medication.
P: I already use a bit of cinnamon in my oatmeal. How much should I be incorporating?
A: That's great! A small amount, around half to a full teaspoon daily, is generally considered safe for most people. Just be mindful not to overdo it.
P: I will keep that in mind. And what about fenugreek seeds?
A: Adding a teaspoon of fenugreek seeds to your meals or soaking them overnight and consuming the water can be beneficial. Always consult with your doctor before starting any new natural remedies.

A: Fatma, could you tell me more about how your knee arthritis affects your daily walks? Does it cause discomfort or pain after a while?
P: Yes, it gets painful after a short while. I try to walk slowly and take rests but the discomfort is still there.
A: It might help to do some gentle stretching exercises before you start walking. This could warm up your muscles and joints, potentially reducing the discomfort. But remember not to push yourself too much. Safety is important.
P: That sounds good. Any specific stretches you'd recommend?
A: You may want to try hamstring stretches or a calf stretch. Remember to keep the movements gentle and slow. If you feel any sharp pain during these stretches, you should stop right away. It may also be beneficial to consult a physiotherapist.
P: I'll try these out and consider seeing a physiotherapist if needed. Thank you for your advice!
A: You're very welcome, Fatma! Just remember, there's no rush. Go at your own pace and listen to your body. Stay safe, and feel free to reach out if you have more questions or concerns.

Conversation 15

P: Sometimes I feel really low energy during the afternoon. Could that be related to my diabetes?
A: Yes, Ali, it’s possible that your blood sugar levels are varying before or after lunch. Have you been monitoring them during the day?
P: Not really, I've mainly focused on checking my levels in the morning.
A: It’s important to also check your blood sugar around the times you feel these energy dips, like in the afternoon. This can help you understand if the low energy is related to your blood sugar levels.
P: I'll start doing that. Should I also adjust my meals or snacks?
A: Yes, incorporating a balanced snack between meals, especially one with protein and fiber, can help stabilize your blood sugar and improve energy levels.
P: That makes sense. I'll try adding a snack and see how it goes.
A: Great! Keep track of how you feel and adjust as needed. If you need any suggestions on snacks or further adjustments, just let me know.

A: Mehmet, have you been able to maintain your exercise routine despite the unpredictable weather in Amsterdam?
P: I've been trying, but the rain sometimes gets in the way of my walks.
A: Completely understandable. Did you know that indoor exercise options can be just as effective? You might consider activities like indoor cycling, yoga, or even following workout videos online that don't require you to leave the house.
P: That's a good idea. I haven't tried indoor cycling yet, but it sounds like a fun alternative.
A: It can be a great way to stay active on rainy days. Plus, it's low-impact, which is good for joint health. You can often find classes or even use a stationary bike at home.
P: I'll look into getting a stationary bike then. Thanks for the suggestion!
A: You're welcome, Mehmet! Exploring different indoor activities can keep your exercise routine flexible and interesting, no matter the weather. Let me know how it goes with the cycling or any other indoor activities you try.

P: I feel a bit overwhelmed with managing my diet as part of my diabetes care. Sometimes I don't know where to start.
A: Start with small, manageable changes, Mehmet. Base your meals around whole, unprocessed foods. For instance, limit the consumption of processed carbohydrates and swap white rice for brown rice or bulgur.
P: I'll try that. What about portion sizes? How should I manage those?
A: Try to fill half your plate with non-starchy vegetables, a quarter with lean protein like grilled chicken or fish, and the remaining quarter with healthy carbs such as sweet potatoes or brown rice.
P: That's helpful. And if I crave something sweet?
A: Opt for natural sources of sweetness like fresh berries or an apple. Combining them with a protein, like a handful of nuts, may help manage your cravings while stabilizing your blood sugar.
P: Great, I'll keep these ideas in mind. Thanks for guiding me.
A: You're welcome, Mehmet. It all adds up over time. Consistency is key.

P: Lately, I've noticed I'm losing weight even though I haven't changed my diet or exercise routine. Could this be related to my diabetes?
A: Unplanned weight loss can indeed be a symptom of uncontrolled diabetes. High blood sugar levels can cause your body to use muscle and fat for energy, leading to weight loss.
P: I see. Should I be worried and inform my doctor immediately?
A: Yes Ali, it’s important you discuss this with your doctor as soon as possible. Adjustments to your treatment plan may be needed to better control your blood sugar levels.
P: In the meantime, is there anything I can do to manage this?
A: Keep monitoring your blood sugar levels closely and make sure to maintain your balanced diet and regular exercise. Follow up with any concerns during your doctor's visit to ensure the right steps are taken.
P: Okay, I'll schedule an appointment. Thanks for your advice.

A: Hi Julia, have you been experiencing problems with your vision recently?
P: Yes, I've noticed that my vision gets a bit blurry at times.
A: Changes in vision can sometimes be related to high blood sugar levels. Have your blood sugar levels been high on days you notice this?
P: Now that you mention it, I think they may have been higher on those days.
A: High blood sugar levels can cause the lens in your eyes to swell, affecting your ability to to see clearly. It's important to manage your blood sugar to help prevent these fluctuations. I recommend monitoring your levels more closely, especially on days when you notice changes in your vision.
P: That makes sense. I'll start tracking my blood sugar more diligently and see if there's a pattern with the changes in my vision. Thanks for pointing that out. I hadn't connected the two before.

Conversation 20

A: Jan, can you share how often you've been checking your blood sugar and what the results were this past week?
P: I have been checking my blood sugar every morning before breakfast and it has mostly been between 7 and 9 mmol/L.
A: Those readings are a bit higher than the ideal fasting blood sugar range for diabetic patients, which is between 4 and 7 mmol/L. Could there be any changes in your diet or medication that might be affecting these levels?
P: Not really. I've been maintaining my usual diet and taking my medications regularly. Maybe I've been eating a bit late in the evenings.
A: Eating late in the night can indeed affect your fasting blood sugar levels. It's best to have your dinner at least two hours before bedtime to give your body time to process the food. Also, try to include more fiber-rich foods in your evening meal to help control sugar spikes.
P: I'll bear that in mind and try to adjust my dinnertime accordingly. What about physical activity? Do you think it can help lower my morning sugar levels?
A: Absolutely, Jan. Regular exercise is a key part of managing diabetes because it helps the body use insulin more effectively. Try to include at least 30 minutes of moderate-intensity activity, like brisk walking, in your daily routine.
P: Thanks for the advice. I'll start implementing these changes and see if they make a difference
